

Good afternoon

I require a pergola that will be suitable to carry the weight of solar panels.

I estimate we will need one that is approximately 11m length and 2.5m width.

It is to run along the straight length of the house.

It will need to be strong enough to carry 11 solar panels with a dimension of 1790mm x 1134mm. The weight of each individual panel is 25kg.

I will only require steel roofing on an about half of the overall size.

Thanking you
